## 1 Ordinary Differential Equation of 1<sup>st</sup> Order

Ordinary Differential Equations (or short ODEs) are equations where a derivative of one variable is present. The order of an ODE is defined by the largest derivative in the equation.

### 1.1 Seperable ODE

These are equations of the form

$$y' = f(x)g(y) \quad (1.1)$$

The functions  $f(x)$  and  $g(y)$  can be seperated in a way that all y are on one side and all x are on the other side. It is benificial to leave negative signs on the right side.

1. bring  $f(x)$  and  $g(y)$  to each side:  $y' \frac{1}{g(y)} = f(x)$
2. rewrite differential expression:  $\frac{dy}{dx} \frac{1}{g(y)} = f(x)$
3. integrate both sides  $\int \frac{1}{g(y)} dy = \int f(x) dx$
4. if necessary, bring y on one side:  $y(x) = \dots$

### 1.2 Euler-Homogeneous ODE

This equations look like

$$y' = g\left(\frac{y}{x}\right) \quad (1.2)$$

By using an appropriate substitution, the Euler-Homogeneous ODE can be transformed into a seperable ODE and than solved accordingly. The challenge is to find the right substitution. This largely depends on the right hand side of the equation. Some important substitutions are:

form	$y' = g\left(\frac{x}{y}\right)$	$y' = g(x + y)$
substitution	$u = \frac{x}{y}$	$u = x + y$
derivative	$y' = u'x - u$	$y' = u' - 1$
example	$y' = \frac{1}{2} \left( \frac{y}{x} - \frac{x}{y} \right)$	$y' = \sin(x + y)$

In general, the process of solving this type of equation is

1. find substitution  $u = \dots$
2. calculate the derivative  $y' = \dots$
3. insert into the original equation
4. solve the now seperable ODE
5. resubstitute  $y = \dots$

### 1.3 Linear ODE of 1<sub>st</sub> Order

These are equations of the form

$$y' + p(x)y = r(x) \quad (1.3)$$

Here,  $p(x)$  and  $r(x)$  can be an arbitrary function of  $x$ . In the special case where  $r(x) = 0$ , the ODE is seperable and can be solved according to chapter 1.1

#### 1.4 Bernoulli ODE

#### 1.5 Transformation to New Coordinate System

#### 1.6 Transformation to Polar Coordinates

#### 1.7 Exact ODE and Total Differential

#### 1.8 Excursion: Constructing Trajectories

##### 1.8.1 Orthogonal Trajectories

##### 1.8.2 Isogonal Trajectories

### 2 Ordinary Differential Equation of 2<sup>nd</sup> Order

#### 2.1 Conversion to 1<sup>st</sup> Order ODE

### 3 Ordinary Differential Equation of N<sup>th</sup> Order
